area of detail

The TMJ is a hinge and gliding joint and is the most constantly used joint in the body.

TMJ - Temporomandibular Joint

**Normal Temporomandibular Joint
relationship and Movement**

**Anterior Disc Displacement with
Reduction
Posteriorized Condyle**

Anterior Disc Displacement non-reducing

Degenerative Arthritis

Posterior Displaced Condyle

Arthokinetic Reflex

- Iceberg et al. described an **arthrokinetic reflex** in the muscles of mastication associated with disc displacements. Continuous muscle activity was provoked by disc displacements and ceased when the disc position was normalized on mouth opening, only to occur again every time the disc became displaced on mouth closure. These findings were in line with previously published on limb joints that indicated that joint derangements are a cause of muscle hyperactivity.

Trigeminal Nerve

TMD Symptoms

EARS

1. Hissing, buzzing or ringing
2. Decreased hearing
3. Ear pain, ear ache, no infection
4. Clogged, "itchy" ears
5. Vertigo, dizziness

JAW

1. Clicking, popping jaw joints
2. Grating sounds
3. Pain in cheek muscles
4. Uncontrollable jaw and/or tongue movements

NECK

1. Lack of mobility, stiffness
2. Neck pain
3. Tired, sore muscles
4. Shoulder aches and backaches
5. Arm and finger numbness and/or pain

THROAT

1. Difficulty swallowing
2. Laryngitis
3. Sore throat with no infection
4. Voice irregularities or changes
5. Frequent coughing or constant clearing of throat
6. Feeling of foreign object in throat constantly

HEAD PAIN, HEADACHE

1. Forehead
2. Temples
3. "Migraine" type
4. Sinus type
5. Shooting pain up back of head
6. Hair and/or scalp painful to touch

EYES

1. Pain behind eyes
2. Bloodshot eyes
3. May bulge out
4. Sensitive to sunlight

MOUTH & TEETH

1. Discomfort
2. Limited opening of mouth
3. Inability to open smoothly
4. Jaw deviates to one side when opening
5. Locks shut or open
6. Can't find bite
7. Clenching, grinding teeth at night
8. Looseness and soreness of back teeth

Auriculotemporal Nerve

Figure 2.1. (a) The skull base of a dry skull. The oval foramen (arrow) through which the mandibular nerve passes is located medial to the articular eminence (dotted line). (b) Coronal tomogram showing the oval foramen (arrow), the articular eminence, and the mandibular condyle (C).

Figure 2.2. Medial view of anatomy of the mandibular nerve.

- 1 Auriculotemporal nerve
- 2 Chorda tympani
- 3 Inferior alveolar nerve
- 4 Lateral pterygoid muscle
- 5 Medial pterygoid muscle
- 6 Mandibular angle
- 7 Masseteric nerve (level of derivation)
- 8 Lingual nerve

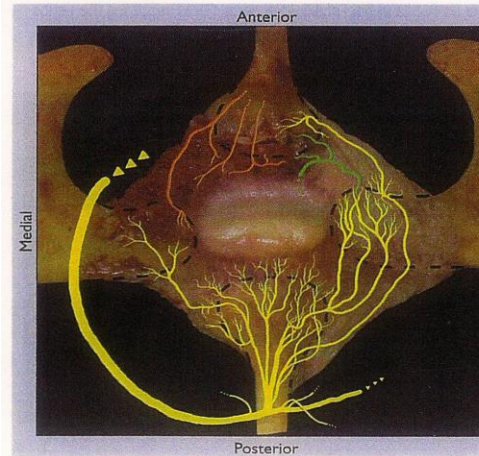

Figure 2.3. Innervation of the TMJ. The auriculotemporal nerve runs medial to the joint, then runs laterally, crossing the posterior border of the condylar neck where it divides into several branches that innervate the capsule and disc attachments posteriorly, laterally and medially. Branches of the masseteric nerve and deep posterior temporal nerves innervate the anterior capsule and anterior disc attachment.

- Auriculotemporal nerve
- Masseteric nerve
- Deep posterior temporal nerves

Peripheral Sensitization

- Compression of the AT nerve may result in a focal neuroinflammation.
- Neuroinflammation spreads from the site of nerve entrapment to the trigeminal ganglion via the mandibular nerve, then to the spinal trigeminal nucleus, as well as the reticular formation of the brainstem.
- Neuroinflammation in the brainstem centers could act as physiological drivers of aberrant reflexive behaviors, as well as supra brainstem changes within the nervous system.

Central Sensitization

- Central sensitization is a condition of the nervous system that is associated with the development and maintenance of chronic pain. When central sensitization occurs, the nervous system goes through a process called *wind-up* and gets regulated in a persistent state of high reactivity. This persistent or regulated, state of reactivity lowers the threshold for what causes pain and subsequently comes to maintain pain even after the initial injury might have healed.
- Pain
- CNS Changes

Central Sensitization

- exaggerated response of the CNS
- changes following tissue injury and/or nerve damage
- increase in noxious stimulation
- sensory input from a site of peripheral trauma into the CNS

Cranial Nerves

12 Cranial Nerves

Nerve Fibers

Motor fiber types

Type	Erlanger-Gasser Classification	Diameter	Myelin	Conduction velocity	Associated muscle fibers
a	A α	13–20 μm	Yes	80–120 m/s	Extrafusal muscle fibers
γ	A γ	5–8 μm	Yes	4–24 m/s [2][3]	Intrafusal muscle fibers

Sensory fiber types

Type	Erlanger-Gasser Classification	Diameter	Myelin	Conduction velocity	Associated sensory receptors
Ia	A α	13–20 μm	Yes	80–120 m/s ^[4]	Responsible for proprioception
Ib	A α	13–20 μm	Yes	80–120 m/s	Golgi tendon organ
II	A β	6–12 μm	Yes	33–75 m/s	Secondary receptors of muscle spindle All cutaneous mechanoreceptors Some Nociceptors ^[5]
III	A δ	1–5 μm	Thin	3–30 m/s	Free nerve endings of touch and pressure Nociceptors of neospinothalamic tract Cold thermoreceptors
IV	C	0.2–1.5 μm	No	0.5–2.0 m/s	Nociceptors of paleospinothalamic tract Warmth receptors

Somatosensory Receptors

Sensory receptors are classified into five categories: mechanoreceptors, thermoreceptors, proprioceptors, pain receptors, and chemoreceptors.

Somatosensory receptors of the oral tissues are generally divided into mechanoreceptors, nociceptors, and thermoreceptors.

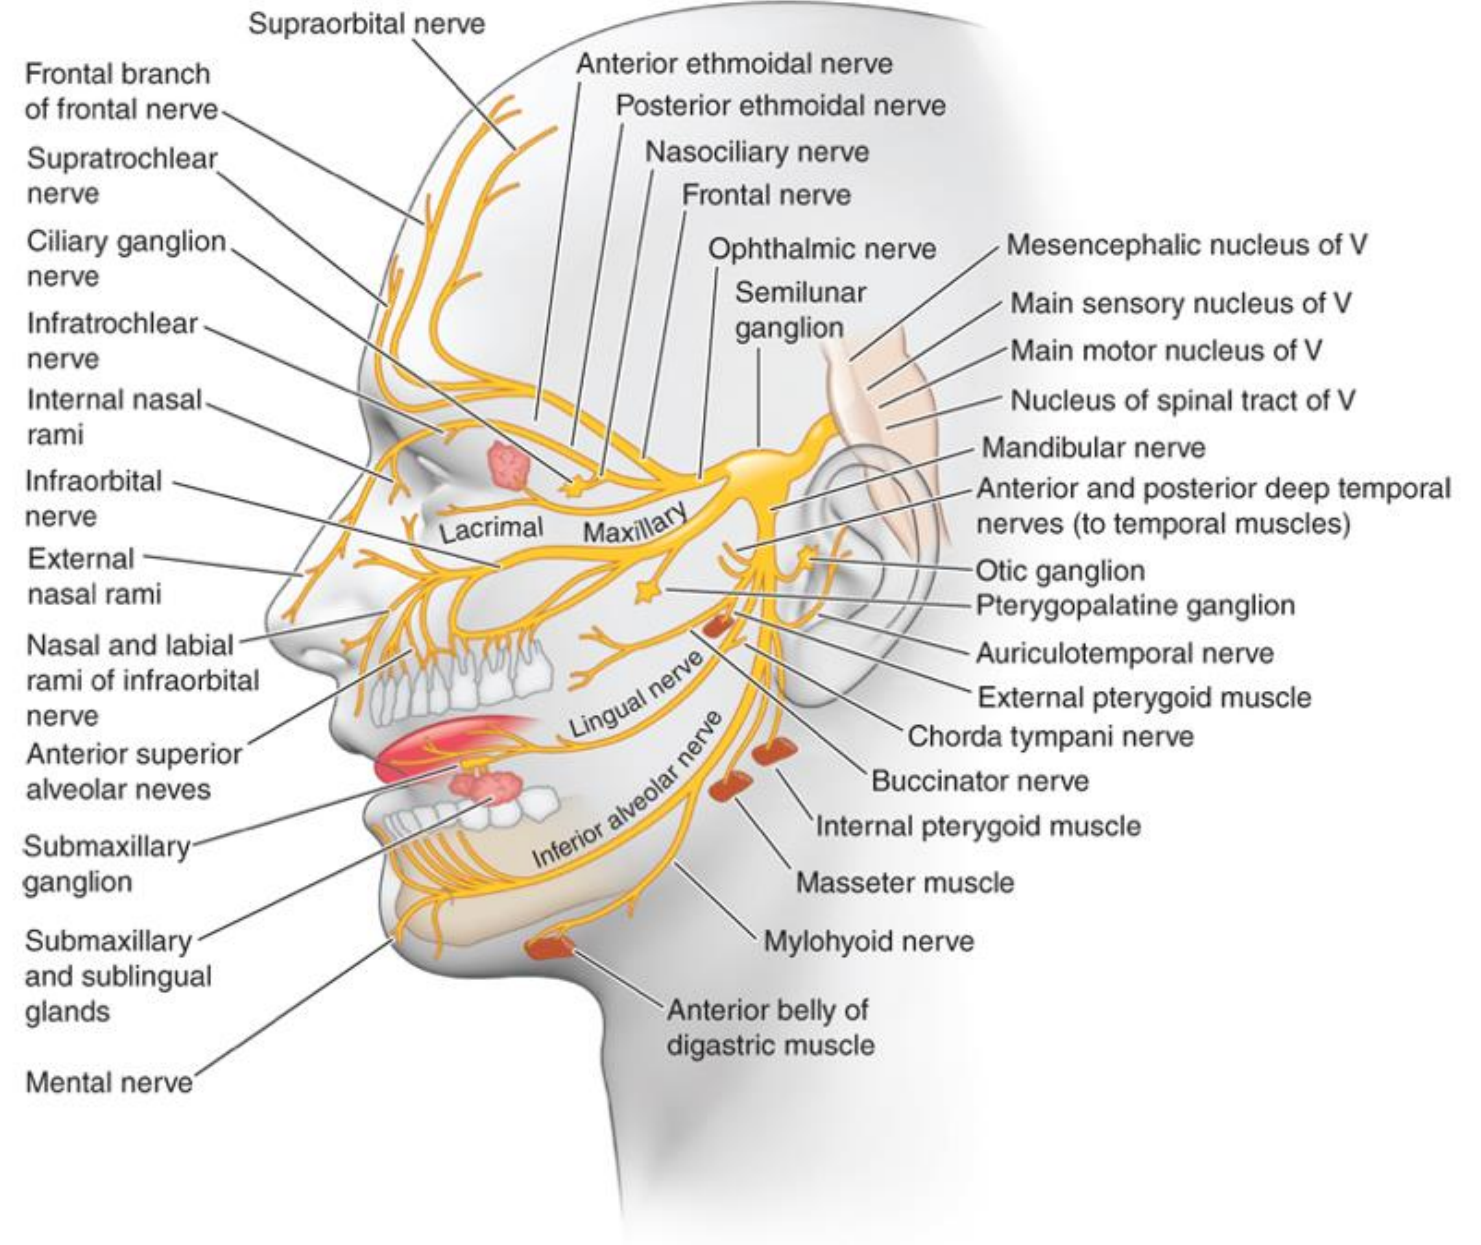

- There are four principal types of mechanoreceptors:
- Meissner corpuscles, rapidly adapting type I, respond to light touch and adapt rapidly to changes in texture.
- Ruffini endings, slowly adapting type II, detect tension deep in the skin and fascia.
- Merkel discs, slowly adapting type I, detect sustained pressure.
- Pacinian corpuscles, rapidly adapting type II, in the skin and fascia detect rapid vibrations.

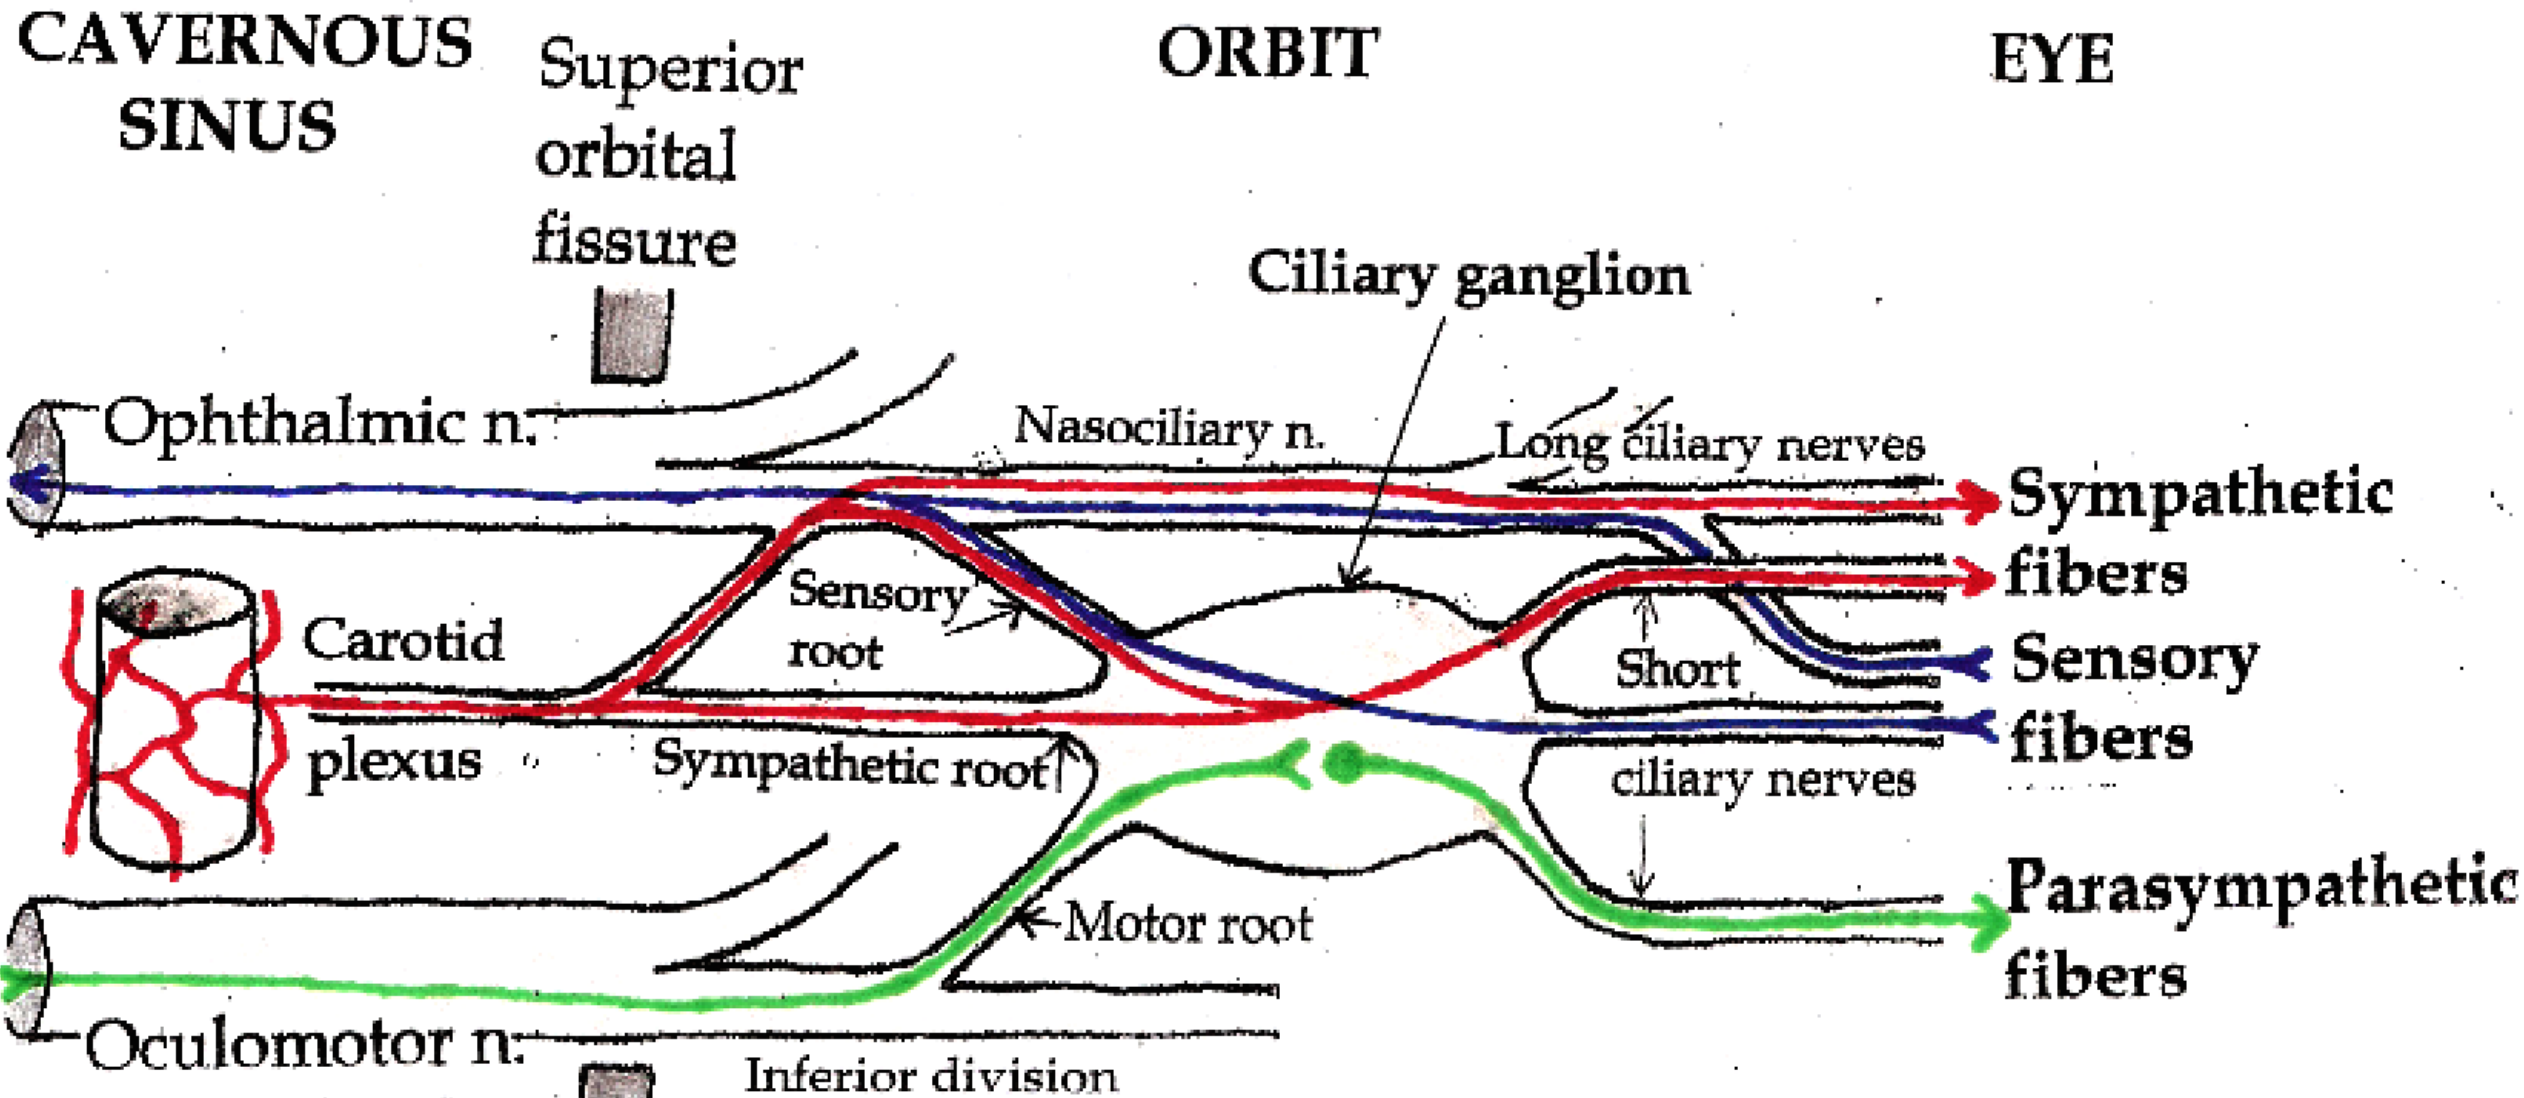

Proprioceptors:

- Muscle Spindles: mechanoreceptors between muscle fibers
- Golgi Tendon Organs: mechanoreceptor
- Free nerve endings detect temperature, mechanical stimuli (touch, pressure, stretch), or nociception (polymodal receptors)
- Most A-delta and C fibers end as free nerve endings.

PAMPs

DAMPs

The Signaling and Transcriptional Regulation of Th17 Polarization

Osteoblasts

- Mononucleated cells derived from terminally differentiated MSCs
- Line surface of the bone and produce osteoid
- Become bone cells or osteocytes

Osteoclasts

- Derived from hematopoietic stem cells (myeloid-monocyte and macrophage precursor cells)
- Multinucleated cells responsible for bone resorption
- Release lysosomes, organic acids and hydrolytic enzymes and break down bone matrix
- Two parts: ruffled border, clear zone
